This report provides information on performance of non-GMO soybean varieties grown under certified organic management in 2018. This research is funded by Organic Farmers of Michigan.

Testing Procedures

Three trial locations are reported in this publication. A total of 41 soybean varieties were entered by eight seed companies and two universities. The cooperators, planting dates, harvest dates and other site details for each location are listed below.

Seed was planted in 2-row plots, 26 feet long with 30-inch row spacing at a depth of 1.5 inches. The planting rate was 180,000 seeds/Acre. At each location, varieties were replicated four times in a lattice design. The plots were trimmed to a length of 20 feet and both rows were harvested. Experimental design, data management and data analysis were conducted with AGROBASE Generation II software (Agronomix Software, Inc., Winnipeg, Canada).

Using the data

Yield: Expressed as bushels per acre (Bu/A) at 13 percent moisture and is reported as single and across site means for 2018.

Height: Plant height, reported in inches, was measured at maturity from the soil surface to the tip of the main stem. The reported values are means of all replications at the Tuscola and Isabella sites.

Protein and oil content: Protein and oil content of the seed was determined using near-infrared reflectance and is expressed on a **dry** basis. (These reports prior to 2017 used 13 percent basis).

Test site information

Isabella County

Nearest city: Rosebush

Cooperator: Matt Graham

Soil type: Ithaca Loam

Previous crop: Corn

Planting Date: June 13

Harvest Date: November 21

Tuscola County

Nearest city: Unionville

Cooperator: Dave Sting

Soil type: Tappan-Londo Loam

Previous crop: Corn

Tillage: Fall plowed, spring field cultivate

Planting Date: May 28

Harvest Date: October 22

Kalamazoo County

Nearest city: Hickory Corners

Cooperator: W.K. Kellogg Bio Station

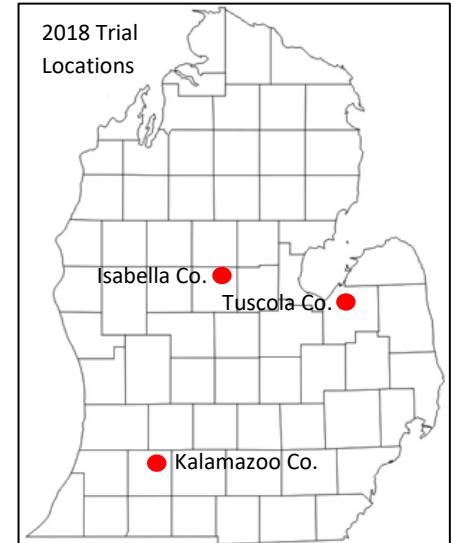

Soil type: Sandy loam

Previous crop: Corn

Tillage: Chisel plow, field cultivate

Planting Date: June 7

Harvest Date: October 19

Planting soybean plots in Kalamazoo Co, June 7.

Tuscola County organic soybean variety trial, September 8.

Growing conditions/comments

Isabella: Wet conditions delayed planting a little and, to a greater degree, harvest.

Tuscola: Conditions were near average.

Kalamazoo: Conditions were near average.

Selecting a variety

Least Significant Difference (LSD) values are useful when comparing two varieties in the same table. If the difference between two varieties is less than the LSD value, this difference is probably due to chance or minor environmental differences. However, if the difference between two varieties is greater than the LSD, there is a 95 percent or greater probability that the difference in performance is due to the greater yield potential of one variety. Valid comparisons can only be made between averages in the same column. The C.V. is indicative of the trial precision. Lower C.V. values indicate more precise trials.

The primary consideration in selecting a variety is yield. When evaluating a variety, consider yield performance over locations and across several years, if available. Considerations other than yield are also important in selecting a variety. It is especially important to select a variety that will mature before the first frost in the fall.

Growers should note seed size when selecting planting rates. Planting rates should be based on number of seeds per acre and not on pounds per acre. It often benefits growers to select a few good varieties for planting each year. Yield determination and careful field evaluation during the growing season will add to the grower's knowledge of variety performance and allow for better selection.

Harvesting the Kalamazoo site, October 19.
